Avian Fog Force® TR

Avian FogForce® TR is an automated, time-release aerosol system. Suitable for use around humans and pets, its pleasant scent comes from the active ingredient, Methyl Anthranilate (MA), which is commonly used as a food flavoring and in perfumes. MA creates a discomfort that only birds find highly irritating, prompting them leave the treated area and avoid returning.

Training Period (1-4 Weeks)

- **Expect Results Over Time:** While effective quickly, consistent operation trains birds to avoid the area permanently. You'll notice a significant reduction in bird presence and related issues.
- **Continuous Learning:** Birds never get used to the irritation, ensuring lasting behavior change and effective long-term deterrence.
- **Automated & Discreet:** This programmable dispenser works silently, releasing fine, harmless repellent mist at set intervals. It maintains a bird-free zone without producing loud noises or visual disruptions.

Once the birds learn to stay away, you may decide to adjust to a lower frequency. Monitor bird pressure and increase frequency if any bird issues start again.

For aggressive or persistent bird problems, Avian FogForce® TR can be used simultaneously with targeted Avian Control® liquid spray or fog applications for potentially faster and more comprehensive results.

Application Tips

Coverage

Each aerosol canister can treat up to 42,000 cubic feet of space. Consider the volume of your area when determining the number and placement of units needed for optimal coverage.

Protection From Rain

Mount the Fog Force® TR dispenser under a covering, such as an eave, roof, or overhang, to protect from direct rain.

Temperature Note

Avian Fog Force® TR is not effective in temperatures below 50°F (10°C).

Read This First: Set Up Guide

1 Install Batteries & Fog Force® Canister

Power the dispenser with two "D" batteries (which typically last up to six months). Place the Avian FogForce® TR aerosol canister inside the dispenser unit.

2 Placement

Attach the unit to a wall or under an overhang/eave in the area where birds are problematic. Point the dispenser in the general direction of the nuisance birds or their expected approach. A distance of at least 5 feet from any structure or object helps ensure complete dissipation of the mist.

3 Program Dispenser

Manually set the time intervals for the repellent mist to be emitted. The dispenser uses a light sensor for day or night modes. We recommend using a higher frequency setting, misting every 7.5 minutes for 24 hours a day, during the initial training period.

4 Maintenance

Aerosol Canisters: Each aerosol canister lasts up to 30 to 60 days, depending on your programmed setting and frequency. Replace canisters as needed.

Batteries: Replace the two "D" batteries in the dispenser unit approximately every six months, or when the indicator light suggests.

Note that Avian FogForce® TR is not available for sale outside of the continental United States. While the mist is harmfree and EPA registered for overspray on to food, avoid directly spraying onto people, pets, or food.
